

WIND LOADING ANALYSIS - Main Wind-Force Resisting System

Per ASCE 7-05 Code Method 2 for Enclosed or Partially Enclosed Buildings

Design Wind Load Case 2 from Figure 6-9

ASCE 7-05 Figure 6-9 - Design Wind Load Case 2

$$M_T = 0.75 (P_{WX} + P_{LX}) B_X e_X$$

$$e_X = \pm 0.15 B_X$$

Input Data:

Bldg. Dimension (x-dir.) =	100.00	ft.
Bldg. Dimension (y-dir.) =	200.00	ft.
Windward, Pw _x =	0.0290	ksf
Leeward, PL _x =	0.0080	ksf

Application of Additional Torsional Moment

Results:

Length, B _x =	200.00	ft.
Length, B _y =	100.00	ft.
Eccentricity, e _x =	30.00	ft., e _x = 0.15*B _x
Tors. Moment, M _T =	166.5	ft-k, M _T = 0.75*(P _{wx} +P _{Lx})*B _x *e _x
Perimeter Force, q _w =	0.004163	kips/ft./ft. Ht., q _w = M _T /(2*B _x *B _y)
Applied Load, P ₁ =	0.416	kips/ft. Ht., P ₁ = q _w *B _y
Applied Load, P ₂ =	0.833	kips/ft. Ht., P ₂ = q _w *B _x

Note: Loadings P₁ and P₂ are to be applied per ft. of building height.

$$M_T = 0.75 (P_{WY} + P_{LY}) B_Y e_Y$$

$$e_Y = \pm 0.15 B_Y$$

Input Data:

Bldg. Dimension (x-dir.) =	100.00	ft.
Bldg. Dimension (y-dir.) =	200.00	ft.
Windward, Pw _y =	0.0298	ksf
Leeward, PL _y =	0.0025	ksf

Application of Additional Torsional Moment

Results:

Length, B _x =	200.00	ft.
Length, B _y =	100.00	ft.
Eccentricity, e _y =	15.00	ft., e _y = 0.15*B _y
Tors. Moment, M _T =	36.3	ft-k, M _T = 0.75*(P _{wy} +P _{Ly})*B _y *e _y
Perimeter Force, q _w =	0.000908	kips/ft./ft. Ht., q _w = M _T /(2*B _x *B _y)
Applied Load, P ₁ =	0.091	kips/ft. Ht., P ₁ = q _w *B _y

Applied Load, $P_2 = 0.182$ kips/ft. Ht., $P_2 = q_w \cdot B_x$

Note: Loadings P_1 and P_2 are to be applied per ft. of building height.

Version 1.4
